                                                                                                                                                                                                                                              /note="Torgan: Stomach; Vector: pCNS; Site_1: EcoRI; Site_2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Top10F' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            590
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Research

/note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; NCI_CGAP_FT2 is a subtracted cDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions, other donor macrophages in different conditions, the mRNA samples were pooled for library control 24 hours; control 3 hours; Control 3 hours; Control 3 hours; Klebsiella moi 10 ng/ml, 24 hours; Staph aureus moi 10, 24 hours; Staph aureus moi 10, 24 hours; Adenovirus moi 500, 3 hours; wt adenovirus moi 500, 24 hours; wt adenovirus moi 500, 24 hours; wt adenovirus + LPS 24 hours. The library was subtracted according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. The tissue was provided by Dr. Gary W. Hunninghake of the University
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  311

Email: seqref@genoscope.cns.fr, Web : www.genoscope.cns.fr
1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a
division of Invitrogen.
This sequence belongs to sequence cluster 5445.f

    source
             This CDS has been cloned without stopcodon.
The CDS has been inserted into pDONR201 via a BP reaction. Additional sequence has been added in codon: att. .AAAAAA GCA GGC TCC ACC (ATG).
The last codon is followed by the 3' att site: Gi The clone is validated by full sequence check.
Compared to the reference sequence NM_002451 (GI AA exchange(s) at position (first base of change(133 (leu->ser) 166 (ile->val)

The CDS has been inserted into pDONR201 via a BP Clonase ('reaction. Additional sequence has been added in front of codon: att. .AAAAAA GCA GGC TCC ACC (ATG).
The stopcodon is followed by the 3' att site: GACCCAGCTTT The clone is validated by full sequence check.

Direct Submission
Submitted (17-JAN-2001) Sanger Centre, Hinxton, Cambridgeshire,
CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk
On Jan 13, 2001 this sequence version replaced gi:11878000.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences wit

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TEMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr9
RP11-70L8 is from the library RPCI-11.1 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm
VECTOR: pBACe3.6
This sequence is the entire insert of clone RP11-70L8 The true left end of clone RP11-14912 is at 118787 in this sequence. The true left construction/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ribonucleotide formyltransferase (GARFT) and/or aminoimidazolecarboximide ribonucleotide formyltransferase (AICARFT), and administering an antitoxicity agent during and after administration of the inhibitor. The combination therapies can be used for selectively killing MTAP deficient cells, and for treating cell proliferative disorders e.g. lung cancer, leukaemia, glioma, urothelial cancer, colon cancer, breast cancer, prostate cancer, pancreatic cancer skin cancer and head and neck cancer. The anti-toxicity agent counteracts the toxicity of the inhibitor in the MTAP-competent (i.e. healthy) cells and increases the maximally tolerated dose of the inhibitor. This polynucleotide sequence represents the cloned

vectors and host cells comprising a nucleic acid of the invention; the combinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an enthod of detecting conjunctedides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The cinvention further discloses methods of peventing, treating or and/or monoclonal antibodies for carrying out the methods of the invention. The cinvention; methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention configuration of compounds that modulate the useful in diagnostics, drug screening, forensics, gene mapping, in the claritic, for assessing biodiversity, and in producing many other types of charaits, for assessing biodiversity, and an producing many other types of charaits, for assessing biodiversity, and an producing many other types of cancer. The nucleic acids may also be used as hybridisation probes or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides care also useful in generating antibodies, as molecular weight markers, cancer also applements. The present sequence represents a specifically calaimed human cDNA sequence of the invention. Note: The sequence data for obtained : ftp.wipo. and as food social The ADC this patent the nove invention e inventions inventions inventions inventions inventions inventions in the contract of the con numan cDNA sequence of the invention. Note: The sequence data for ant did not form part of the printed specification, but was in electronic format directly from WIPO at int/pub/published\_pct\_sequences. and the polypeptides they encode (ADCJV070-2007), identical with also relates to nucleic acid sequences over 99% identical with human cDNAs. The invention additionally encompasses expression human cDNAs comprising a nucleic acid of the invention; the relates to 971 novel human cDNA sequences (ADC29919-the polypeptides they encode (ADC30890-ADC31860). A cyclin-dependent protein-kinase-4-inhibitor (CDK4I) tumour suppressor gene (AAT15157-58) is located between this gene and an interferon-alpha gene cluster, and has been isolated by chromosome walking. The CDK4I gene, probe and primer derivatives and the gene product may be used in diagnosis of cancer, particularly melanoma (especially dysplastic nevus syndrome), glioma, non-small cell lung carcinoma or leukaemia. The gene may also be used in cancer gene therapy, or in antitumour antisense oligonucleotide or ribozyme construction. Antibodies against CDK4I may be used in diagnosis or in vivo imaging
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cyclin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
phosphorylase (MTase), obtained from a cosmid gene library constructed from human placenta DNA by screening with a MTase cDNA probe. A claimed method for inhibiting the activity adenylsuccinate synthetase (ASS) in C mammalian cells deficient in MTAse activity involves: (a) determining C deficient; and (b) administering an ASS inhibitor (preferably L-C alanosine) to the host so that the MTase deficient host cells are C depleted of AMP. The method is especially used to treat human MTAse-C actute lymphoblastic leukaemia (ALL), glioma and urothelial tumour cells. C MTAse catabolises methylthioadenosine to adenine for endogenous salvage C incorporation into the intracellular AMP pool. The claimed method constructed the cells of substrate for de novo synthesis of AMP.
                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting adenyl:succinate synthetase activity in methylthio:adenosine phosphorylase-deficient cells - by treatment with specific inhibitor, especially L-alanosine, useful for selective killing of MTAse deficient cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 08-MAR-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method for detecting catalytically active and inactive methylthioadenosine phosphorylase (MTAse) in mammalian cells, using oligonucleotide probes which hybridize to MTAse nucleic acid coding regions. Detection of MTAse encoding nucleic acid indicates the cell has catalytically active MTAse. The method is useful for detecting malignant cells with a deficient MTAse gene, useful for identifying malignant cells which are suitable targets for methionine (MET) starvation therapy. The new method is simple, efficient and successful at determining MTAse negative cells, unlike prior art techniques, which include analysis of catalytic activity in cell cultures, requiring a commercially unavailable radiochemical substrate, and immunoassays, using MTAse antibodies which are unable to be produced in sufficient quantities. Recombinant MTAse protein produced using the new polynucleotide and vector, allows greater and purer production of native MTAse. This sequence represents human MTAse encoding DNA which is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
